

**ABSTRACT**

~~The invention relates to a~~ A method and a device are disclosed for follow-up treatment of the contour of the surface of at least one optical lens, in particular a microlens which is made of glass or a glass-type material and which has a convex lens surface delimited by a circumferential line abutting on a plane section surrounding ~~said the~~ the circumferential line and which has a lens underside facing the convex lens surface. ~~The invention, wherein along said~~ Along the circumferential line of the optical lens on ~~said the~~ the plane section is placed a ~~means~~ device perfectly matching ~~said the~~ the circumferential line and at least laterally bordering ~~said the~~ the convex lens surface, ~~said the~~ the optical lens is heated to a temperature of at least the transformation temperature of said glass or glass-type material, pressure equalization prevails between ~~said the~~ the convex lens surface and ~~said the~~ the lens underside, after a certain period of time, during which ~~said the~~ the optical lens undergoes ~~said the~~ the temperature treatment and subsequent cooling below ~~said the~~ the transformation temperature, ~~said means~~ the device is removed from ~~said the~~ the optical lens.
